

Add a map to display all currently planning (no artist found) and finalized events (artist found). Events will have one of two markers on their venue location depending on their status; a marker with an exclamation mark will be on events that are currently planning, and a marker with an eighth note will be on events that are finalized. These markers are interactable and can be clicked for use in future features.

This map should only be available on artist and fan accounts. Because the artist view has not yet been made, only implement this on the fan view.

As you zoom out on the map, all events that are visible on the screen should be added to a list on the side, sorted by distance. When selecting an event from this list, the user will be zoomed in on the event on the map.

Please create dummy data to test these features

- Design different event views for artists and consumers
 - Consumers may click nodes to see event details but have limited interaction
 - Artists may click nodes and have the option to send messages to event organizers
- Start designing chats page
 - Overall layout
 - Ability to switch chats
 - Only for Artists and Venues

Create the chats page. This page should only be accessible to artist and venue accounts. When artists click the map nodes and see the message button, clicking the message button should bring them to the chats page, automatically opening a chat with the organiser of the event. The chats page should also be available simply through a button at the top of the page. With this new addition, you should also include a button to navigate back to the map page. The chat feature should allow users to share messages, images, and files. There will be an option to create new chats and search for people by usernames, with a list suggesting users matching the username as it is typed in. Users will have the ability to navigate to recent past chats using a list, and the ability to close those chats as well.

- Finish designing the chats page
 - Design actual messaging feature
 - Any other polishing
- Designing the filtering system for events

- Add filters for genre, location, and artists
- Highlight any events fitting description
- Add recommended events to list on side, ignoring whether they are visible

Improve the ability to filter for events. As of now, it can only sort for pre-set genres and does not allow the user to search for custom genres. As well, I would like the filtering by location to be more intuitive. Currently, it only allows you to search for events at exact addresses. I want it to be able to search within an entire given town or city, and display to the user all events within that given area sorted by proximity. Moreover, filtered results should not be limited by whether they are visible on the map. If a filter has been applied, events fitting the criteria should be displayed on the side list even if they are not visible on the map, sorted by proximity.

On the artist page when new venues are added and removed from the list on the side, the page also changes sizes and shrinks or expands the map. This makes the map extremely small if there are no venues on screen, and overall makes using it very clunky. Fix this behaviour, making the side list a fixed size that can fit 5 venues and has the ability to scroll down if the number of venues exceeds 5. If needed, add more dummy data to test if the list is functional when venues exceed 5.

Im just gonna put all the small issues/possible features i find here since groks not working for me 2day

~~Venue edit description textbox is not interactable~~ well nothings working on the venue page tbh thats to be expected since it was just a framework made so its fine just remember to like tell grok to lock in and make them interactable ig

Fan page's map still lacks the ability to sort by custom genres

Fan page's events should have more details when clicked (just shows date+time, should show genre, artist, maybe description of venue too)

Need ability to link accounts (spotify, apple music) after account creation
