

GigDash

Overview

GigDash will consist of three separate interfaces:

- Artists would be able to see local venues in their area that matched their preferences and request to book certain time slots.
- Venues would see a list of local artists that matched their preferences and request to book them.
- The customer view would then consist of a map and list view whereby customers who wanted to experience local music and track local artists would be able to view venues around them and their performers at certain times.

Customers could keep track of their favourite artists and where they were performing while venues could see highly rated local artists. Overall the project would serve to connect customers, venues, and artists together, unifying the local gig experience.

Justification

It is a difficult task for venues, artists, and music lovers to connect in the real world and come together to celebrate music. Venues may struggle to get the word out about gig opportunities they have, and struggle to find a good way to schedule events with multiple artists performing. Not only does this make it difficult for venues to organize events, but for artists to hear about opportunities, paid and unpaid, for them to be able to find places to play. If neither the venues nor the artists are able to come together, consumers who want to enjoy music will also likely be unable to find places to go to see live music--much less places that fit the vibe they enjoy. Using the website/app, it would provide a platform for communication between all three parties to be streamlined, as well as being able to do things such as promote popular events and popular artists so consumers of the media can get the best experience possible.

Project Deliverables

General Accounts

- ☐ Design a logo and name for the product
 - ☐ 1:1 icon ratio for app icons
 - ☐ Wider ratio version of the name/icon for website usage on computers
- ☐ Design the account management
 - ☐ Account setup pages for each type of account (venues, artists, consumers)
 - ☐ Editable text boxes to enter usernames (2-20 characters) / password (8+ characters, must include a number and a letter)
 - ☐ Profile preview pages for each type of account, containing information about each account that will be public
- ☐ All accounts should have a cooldown to their ability to rate specific artists/venues (30 days, 1-5 stars)

Venue-side

- ☐ Ability to upload events and gigs to the website, provided them spaces for artists and consumers to
 - ☐ Details about the performers (performers themselves may write this, 100 words or less. Have the ability to create drafts that they can reuse)
 - ☐ Genre of music (can be chosen from 10 provided genres, with the ability to add new ones)
 - ☐ Paid or unpaid (only visible to artist, currency is based off of location)
 - ☐ Size of the venue (option to upload a map of the venue with measurements)
 - ☐ Level of competition (5 levels to choose from)
 - ☐ Time, date, and length of performances (with selection boxes, autofilled with the current date and time where users can change it)
 - ☐ Environment of the venue (choose from 20 options like formal, informal, bar, etc. Can choose multiple tags)
 - ☐ Venue itself will have the ability to create descriptions, 100 words or less
- ☐ Ability to find artists to reach out to by filtering through their appropriate tags (genre, enterable price range, location, dates available)
- ☐ Include a map based system (can use google maps as a base?)
 - ☐ Displaying local events on the map for users to see what is happening nearby
 - ☐ Two different kinds of nodes on the map: owners of establishments can signal they are looking for artists, and establishments with scheduled performances can be marked differently

Artist-side

- ☐ Ability to rate venues (1-5 stars)
- ☐ Ability to block off dates on calendar to avoid being booked.
- ☐ Ability to view available gigs and reach out to the owner through a messaging system
- ☐ Self-identify the music and competition they generally play to recommend certain venues over others to meet their needs (allowed to choose from 10 broad genres, can add more options to their own profile)
- ☐ Ability to link to their other social media/personal website from Spotify or YouTube

Consumer-side

- ☐ Search events, filtering by location, genre, artist, etc.
- ☐ Ability to rate both artists and venues (1-5)
- ☐ May view events looking for artists and scheduled events on the map, but cannot interact with them
- ☐ Can follow artists to be notified of their upcoming gigs
- ☐ Ability to link account to Spotify/Apple Music/Tidal etc. to recommend certain venues based on where other listeners of similar listening habits go to
- ☐ Add a Google Maps integration where all of the venues within the zoomed list shows all of the available venues within the view, adding to a list for the user to find venues based on relevance/distance (kind of like too good to go)

Project Success

1. **Connect Venues to Site:** Secure at least 5 venues with upcoming events. Advertise the website by reaching out to current local venues through direct email connection.
2. **Connect Performers to Site:** Secure at least 20 performers to connect with the venues through
